## LEAMINGTON KITCHEN RANGE, No. 104.

### Leamington Cooking Ranges.

Oven and Boiler, with skirting, 36, 39, 42, 45 and 48 inches  
Two Ovens                   ,,                   ,,                   48, 54, 60 inches

*A wrought iron boiler can be fitted to this Range.*

Strong serviceable 2-oven Range, with high covings and plate rack, similar to illustration, 48, 54, 60 inches

Wrought-iron Back Boilers, extra

### Garton & King's Portable Exeter Ranges.

These Stoves are self-setting, require no extra brickwork, and will be found a very useful Family Cooking Stove

With oven and boiler, 30, 33, 36, 40, 44 inches

With oven only, 30, 33, 36, 40, 44 inches

### Strong Self-Setting Leamington Range.

With oven and boiler, 36, 42 inches

With oven only, 36, 42 inches

With two ovens, 48, 54, 60 inches

*For further particulars see illustrated sheet of Cooking Stoves, which may be obtained on application.*

421 George Street, Sydney.

## DIRECTIONS FOR BRICKLAYER IN SETTING CLOSE AND PATENT FIRE RANGES.

THE principle of setting close Ranges is to exclude all Draught into the Chimney, except that which passes over the fire and through the Flues of the Range into the same.

The Furnace or Fire-place is to be formed of fire-brick of the width of front bars, and the depth at the bottom is to be the size of the bottom grate, sloping backwards to from 8 to 12 inches, according to the size of the Range. The fire-brick sides of this Furnace protect the sides of the Oven and Boiler.

Build a foundation of Brickwork under the Ovens, level and smooth up to the bottom of the soot doors that are in front of the Range. Build up between Oven and Boiler to the level of the bottom of Fireplace, on which place the bottom grate, which will support the fire-brick Furnace. About 2 feet 6 inches to 3 feet above the Hot-plate, cover the opening into the Chimney, between the front of Flues and back of Chimney breast. This covering-in may be formed of slate, sheet iron, or other suitable material, and is generally supported on a bearing-bar of iron in front and brickwork of Flues at the back; in the centre of it a hinged door, or sliding panel, should be fixed for the purpose of cleaning the Chimney.

From the Furnace a separate and entire Flue is carried into the Chimney for each Oven or Boiler, and at about 6 inches below the covering-in, a Damper and Frame is fixed in each of the Flues, by which complete control is obtained over the same.

Underneath all Ranges a square place is left for the Ash Pan.

No Draught Hole nor any Ash Grate Frame is required.

The Flues must be carried according to the following directions :—

### FOR OVEN AND SIDE-BOILER RANGES.

THE OVEN FLUE must be carried from the Furnace over top of Oven, down the side, under the bottom, and up the back, through the Damper Frame and into the Chimney, a short distance above the covering-in plate. Let it be distinctly understood that it must be a *separate* and *entire* Flue, under complete control of the Damper, with its inner surface level and smooth, and in that part round the Oven about 3 inches wide, and nearly the entire length of the Oven, so as to expose as much as possible of the Oven to the heating surface of the Flue. Let care be taken to make firm and smooth the brickwork on the back of the Oven, under the Hot-plate, which is to prevent the heat or fire going direct up the Chimney.

THE BOILER FLUE is carried exactly in the same way as the Oven Flue.

THE CENTRAL FLUE is carried direct from the fire up the centre into the Chimney, the Damper fixed as in the other Flues.

It will be thus seen that three separate and entire Flues are obtained, each under control of its own Damper, so that one and all can be worked or closed as required.

TWO-OVEN RANGES, without Boiler, are also set exactly as in the preceding description.

TWO-OVEN RANGES, with back wrought Boilers. As regards the Ovens, they are set in the same way, but the central Flue is carried underneath the Boiler, and up the back into the Chimney. The Boiler is fixed so that the sloping front shall form the back of the Furnace.

FOR RANGES WITH THREE OR MORE OVENS, &c., AND BOILER FOR BATH AND HOT WATER WORK.—It is recommended that a Fitter and experienced man be sent to fit and fix the Range.

TO FIX BRASS TAP FOR SIDE BOILER.—Place a washer of brown paper, smeared with white lead, under the nut inside the Boiler, and screw up tightly.

## INSTRUCTIONS FOR USING THE KITCHENER.

Before lighting the fire, clear out all the Ashes, and open all the Dampers; then, when the fire is burnt up, they may be all partially closed.

When Boiling on the hot plate, vessels with flat bottoms will be the best.

When the Boiler only is required, open the Boiler Damper, and close the others.

If the Fire only be required, open the Middle Damper, and close the others.

For Roasting in the Oven, open the Ventilator at the top, to allow the vapour or steam to escape, and for Baking, shut it.

When Frying, Broiling, or Boiling, open the Register Door a little, to allow the steam, &c., to escape.

When no cooking is going on, the Plate over the fire may be removed, and the Register door-slide open, which will make an ordinary open fire.

The open fire may be used for Roasting.

The flues should be cleaned out every week; this is done by removing the Plug out of the Hot Plate, raking and brushing the sides and top of the Oven and Boiler, the soot being taken out of the small door in front.

The heat of the Ovens or Roasters may be regulated at pleasure; thus, if both Ovens be required, open the Dampers above each Oven, leaving the centre one closed; but if only one, then open the Damper of such Oven, and close all the others, and the whole heat from the fire will be thrown around the Oven required.

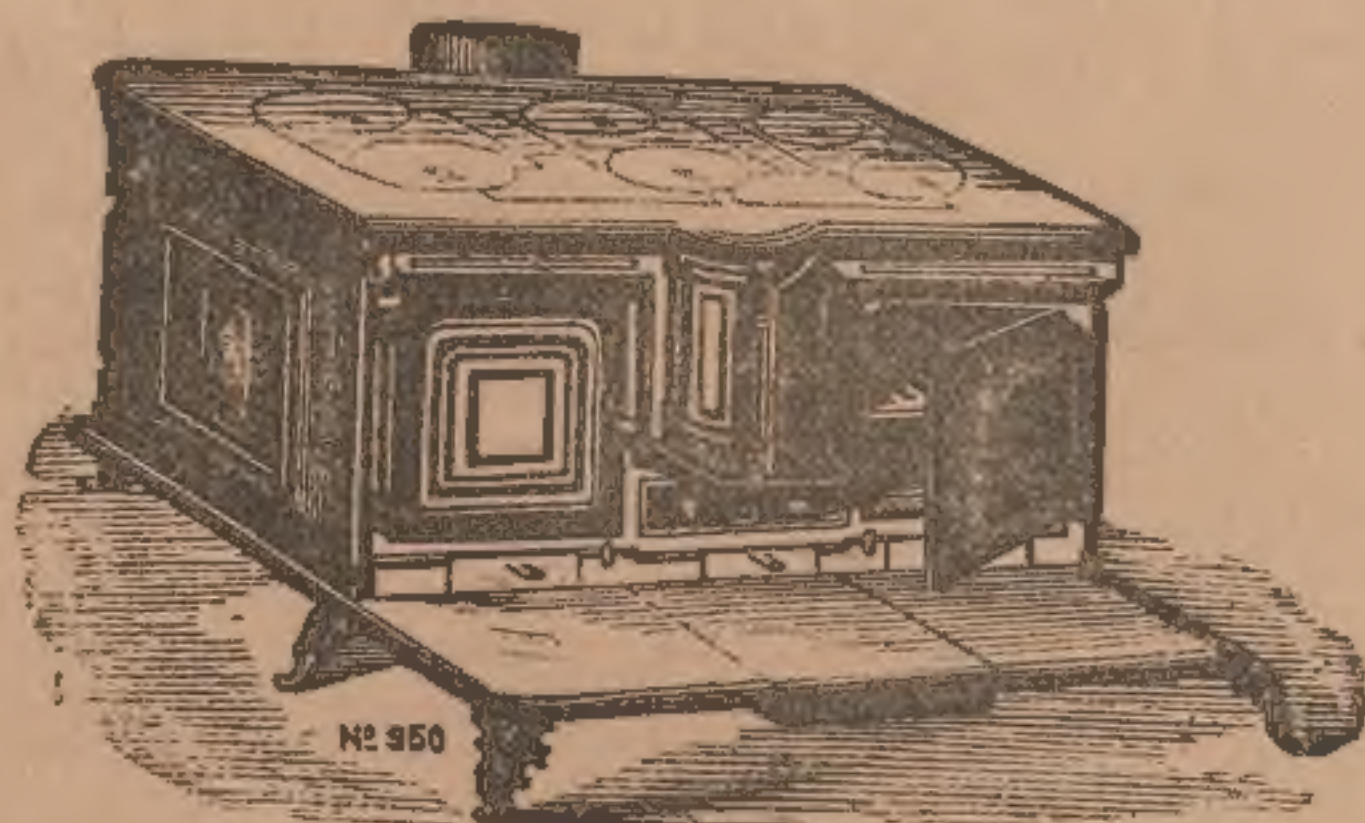

N.B.—The efficiency of this Stove, as in all other Cooking Stoves, is dependent on its being kept clean, and the flues in good working condition.

421 George Street, Sydney.

## PATENT GAS COOKING STOVE

For culinary purposes, gas has been pronounced by the late Mr. Soyer; by the late Dr. Henry Letheby, M.A., and by many other authorities to be the best of fuels. Their opinions have received practical confirmation by its adoption for these purposes, in hospitals and other public institutions, and in clubs and hotels. It is a matter for surprise that having regard to the evidence which has accumulated in its favour during nearly half a century, the advantages of gas for cooking purposes have not been more generally recognised. Without considering the preliminary loss and labour involved in lighting, it is well known that with coal fires, much heat is habitually wasted, even when the most approved form of grate or kitchener is used, and frequently a good fire has to be kept up to do a very trifling amount of work; but with gas there need be no waste, as it is only kept burning while in use, and the consumption can always be regulated to suit the work required to be done. Where a simmering heat is needed, as in the preparation of jellies, preserves, or stews, nothing can be better, since the temperature, being once fixed, will not fluctuate. For broiling, baking, or frying, it is equally well adapted, while roasting by gas has been described as "the very perfection of the culinary art, the meat being cooked uniformly, and its juices (on which the nutritious qualities and delicacy of flavour depend)," being retained until brought to table.

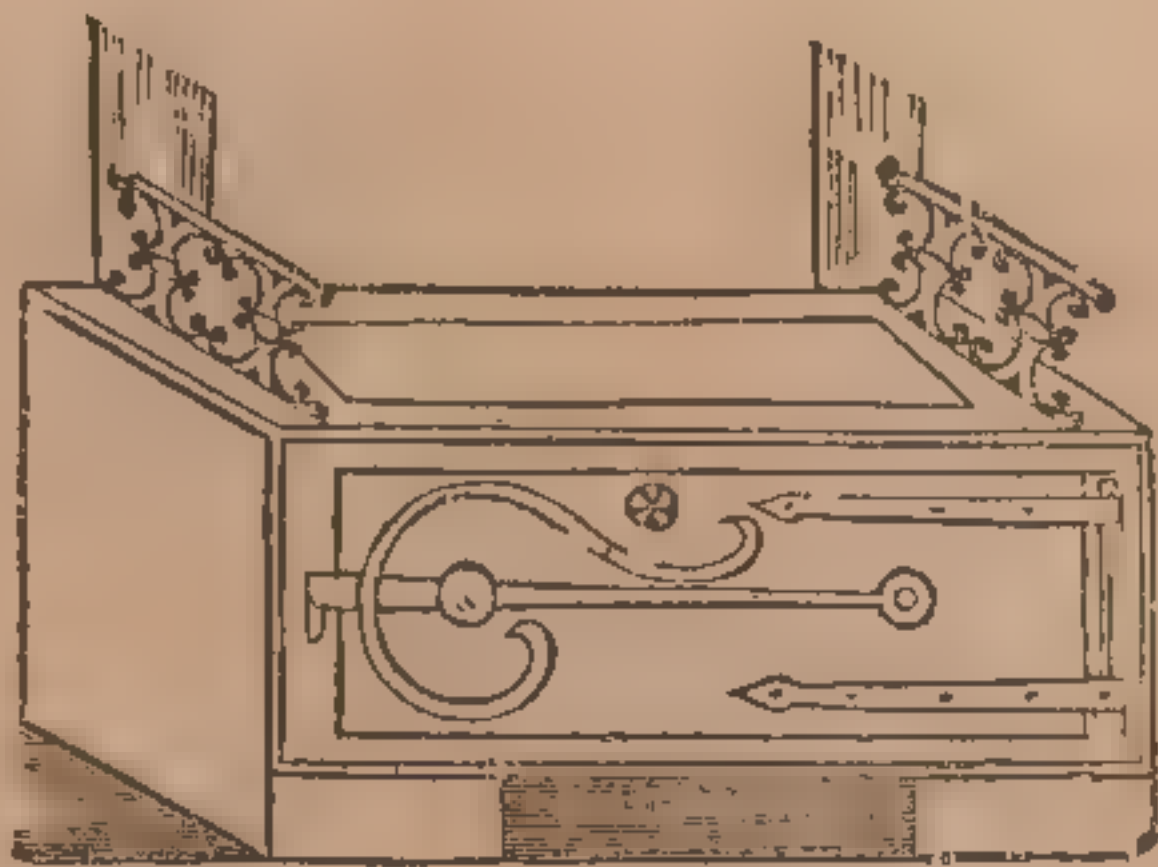

A Variety of other Gas Stoves for Cooking, Heating,  
&c., on hand.

Raleigh's Patent Settlers' Oven, requiring no brickwork.  
Simpson's       "       Colonial Oven,       "       "       "  
*As illustrated.*

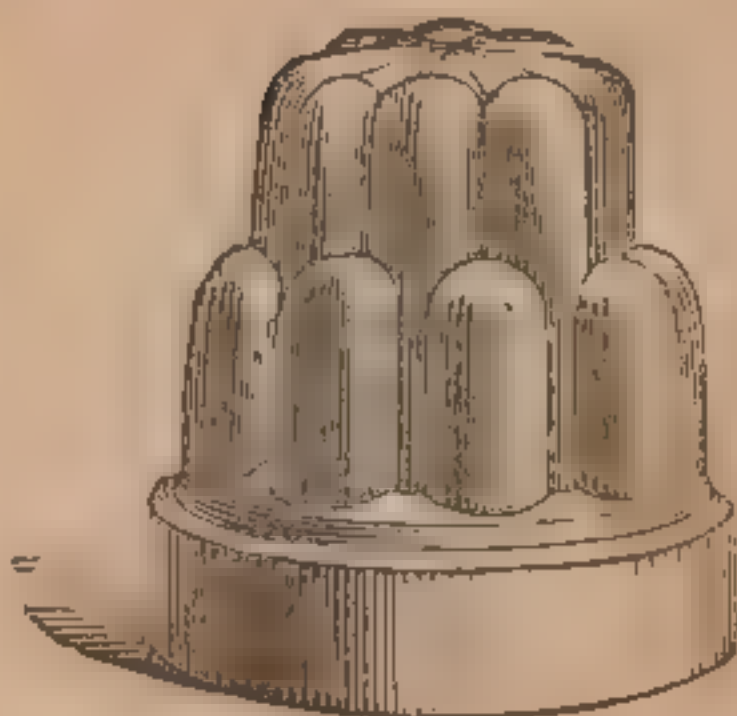

DIRECTIONS FOR SETTING IN.

PLACE the oven in the centre of the fire-place ; the top with hob on each end is intended for the ordinary fire. Have the openings for the smoke from the fire underneath the oven at each end in the front angles ; the opening at that end nearest the corner of the fire-place where the smoke is to pass up the chimney (for medium sized two feet ovens) to be about three inches wide, and at the opposite end about six inches wide—the smoke from the latter having to pass along the end and then turn along the back into the same corner as the smoke from the other end. Let the bottom of the oven all along the back and at each end up to where the openings are left for smoke, rest firmly on brickwork, edge up ; also along the front, leaving an opening in the centre about ten inches wide to put in the fuel and take out the ashes.

## KITCHEN—Continued.

## PATENT ROTARY KNIFE CLEANER.

These useful Machines promote cleanliness and comfort, and effect a saving in time and labour. They are kept in the following sizes:—

Kent's Patent, on Dwarf Stands, for 2, 3, 4, and 5 knives and carver.

„ „ on High Stands, for 4, 5, 6, 7, and 8 knives and carver.

Roche's Patent, on Dwarf Stands, 2, 3, 4, 5, and 6 knives and carver.

## DIRECTIONS FOR KEEPING THE MACHINE IN WORKING ORDER.

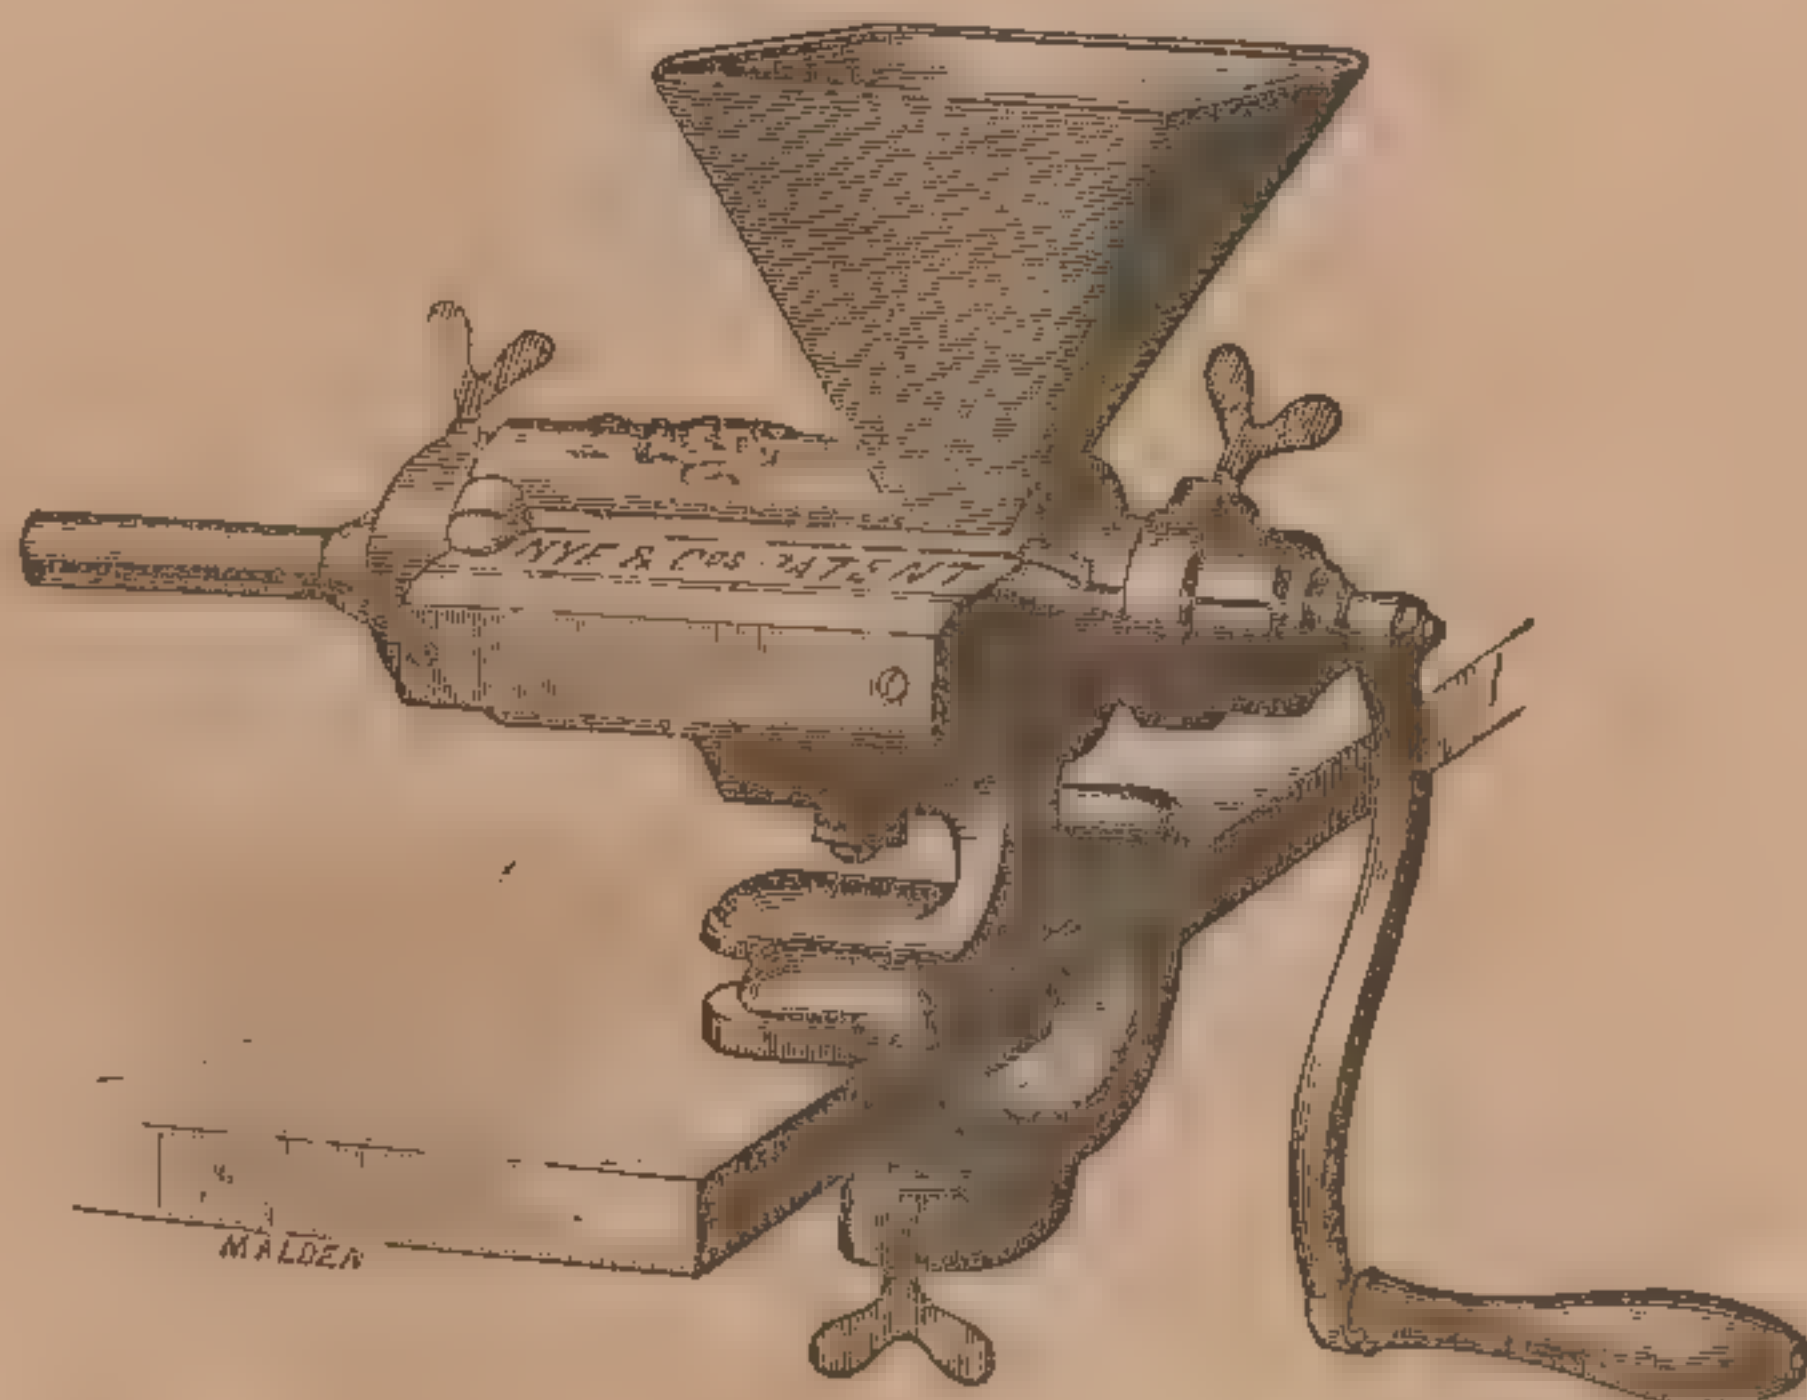

1. Once a month, with a feather, put a little of the best sweet oil on the bearings, in the iron stand, and wherein the axle revolves.
2. If, at any time, it should be found that a much greater number of revolutions are required for the proper performance of the work than usual, it will show there is not sufficient friction: the fault may arise from one or two causes; a deficiency or an overcharge of emery, or want of sufficient pressure on the knives; if the latter, the brushes must be screwed up a little tighter by means of the round brass screw nuts on the axle, back and front, for which purpose a spanner made to fit the nuts will be found attached to the frame under the carver hole. It will, however, be seldom necessary to touch the nuts; but when this is done, screw equally on each, or so that the faces of the brushes meet exactly under the centre of the knife hole. By putting a knife in half way, it will be immediately seen if they are in that position, as the knife will stand perfectly upright.
3. About once in two months take out the turned plug in the side of the drum, and pour in about one or two tablespoonfuls of prepared flour emery, but the quantity must be regulated by the number of knives cleaned—the above would be sufficient for three or four dozen per day. While the machine performs properly, there should be no addition of emery, or the machine may become overcharged, the feeders which convey the emery to the centre of the brushes would choke, and it would then fail to clean; should this occur, take off the top of the drum (which, it will be seen is made to lift off by taking out the few screws, back and front, which hold it), turn the machine over, and pour out the whole of the emery; pass it through a fine sieve, and return as much to the machine as the feeders will work in without being liable to choke. This will be seen by giving the brushes a few revolutions previous to closing the top, or the feeders may sometimes be cleared by sharply jerking the handle (when down) the reverse way.

KITCHEN—Continued.

Captain Warren's Patent Everybody's Cooking Pot.

THE NEW BELLIED COOKER—3, 4, 5, 6, 8 gallons.

HEALTH and economy are secured by this exceedingly useful invention. Meats cooked in this pot are rendered far more nutritious and digestible than if cooked on the old plan of roasting or boiling, and are superior in flavour to those prepared by any other system, while a saving of 2½ oz. in the pound, or from 13 to 15 per cent. in weight is positively effected.

This Cooking Pot consists of three vessels fitting into each other—the lowest containing the water; the second, the meat to be cooked; and the third, or uppermost, is a steamer for vegetables. The lid is made double to prevent the radiation of heat, whilst it also acts as a condenser of the steam, which is returned down a tube into the lowest vessel, whence it issued. The viands, which are placed in the second vessel, are neither boiled nor stewed, but their nourishing juices, usually lost in vapour, are preserved without either loss or dilution, and the meats effectually cooked by the heat of the surrounding steam in the lowest vessel, which steam has no access to them whatever, but passes through a tube into the steamer, or uppermost vessel, which contains a division for two kinds of vegetables.

The advantage of this mode of cooking can only be appreciated by those who have tried it; and a fact worthy of note is, that dinner may be kept waiting for about two hours without detriment to the quality and flavour of the viands.

These Cooking Pots will be found specially adapted for use with the gas stove, as a dinner sufficient for six or eight persons can be cooked with one burner only, at a minimum cost.

The following table will be a guide to those who have not previously used the Everybody's Cooking Pot. The time must be reckoned from the moment at which the water in the outer vessel has been made to boil; but as a general rule the allowance of a quarter of an hour for each pound of meat will be found sufficient.

If the meat is to be served as ROAST, the time for "browning" must be added.

	H. M.		H. M.
A Leg of Mutton, 10 lbs.....	3 0	Ham, 20 lbs. ....	9 0
Beef, 10 lbs. ....	3 30	Hare .....	2 0
Goose .....	2 30	Rabbit .....	1 30
Turkey.....	3 0		

Salt Beef requires one third longer than fresh, and to be cooked with WATER IN THE INNER VESSEL sufficient to cover it. The liquor in which it has been boiled will make superior stock for soup.

TO COOK FISH.—Place the fish in Warren's Pot, with a piece of butter the size of a walnut, add a little pepper and salt, cook for half an hour. The juice of the fish makes an excellent sauce with thickening of flour and water. Fillets of Sole, Turbot, Cod, and Salmon are excellent, cooked by this method, and no sauce or melted butter is necessary beyond the juices left in the vessel.

SOUPS.—Soups are prepared in a Warren's Pot in the usual time in the ordinary way, with the advantage of being richer and stronger, as none of the nutritious ingredients can possibly escape by evaporation.

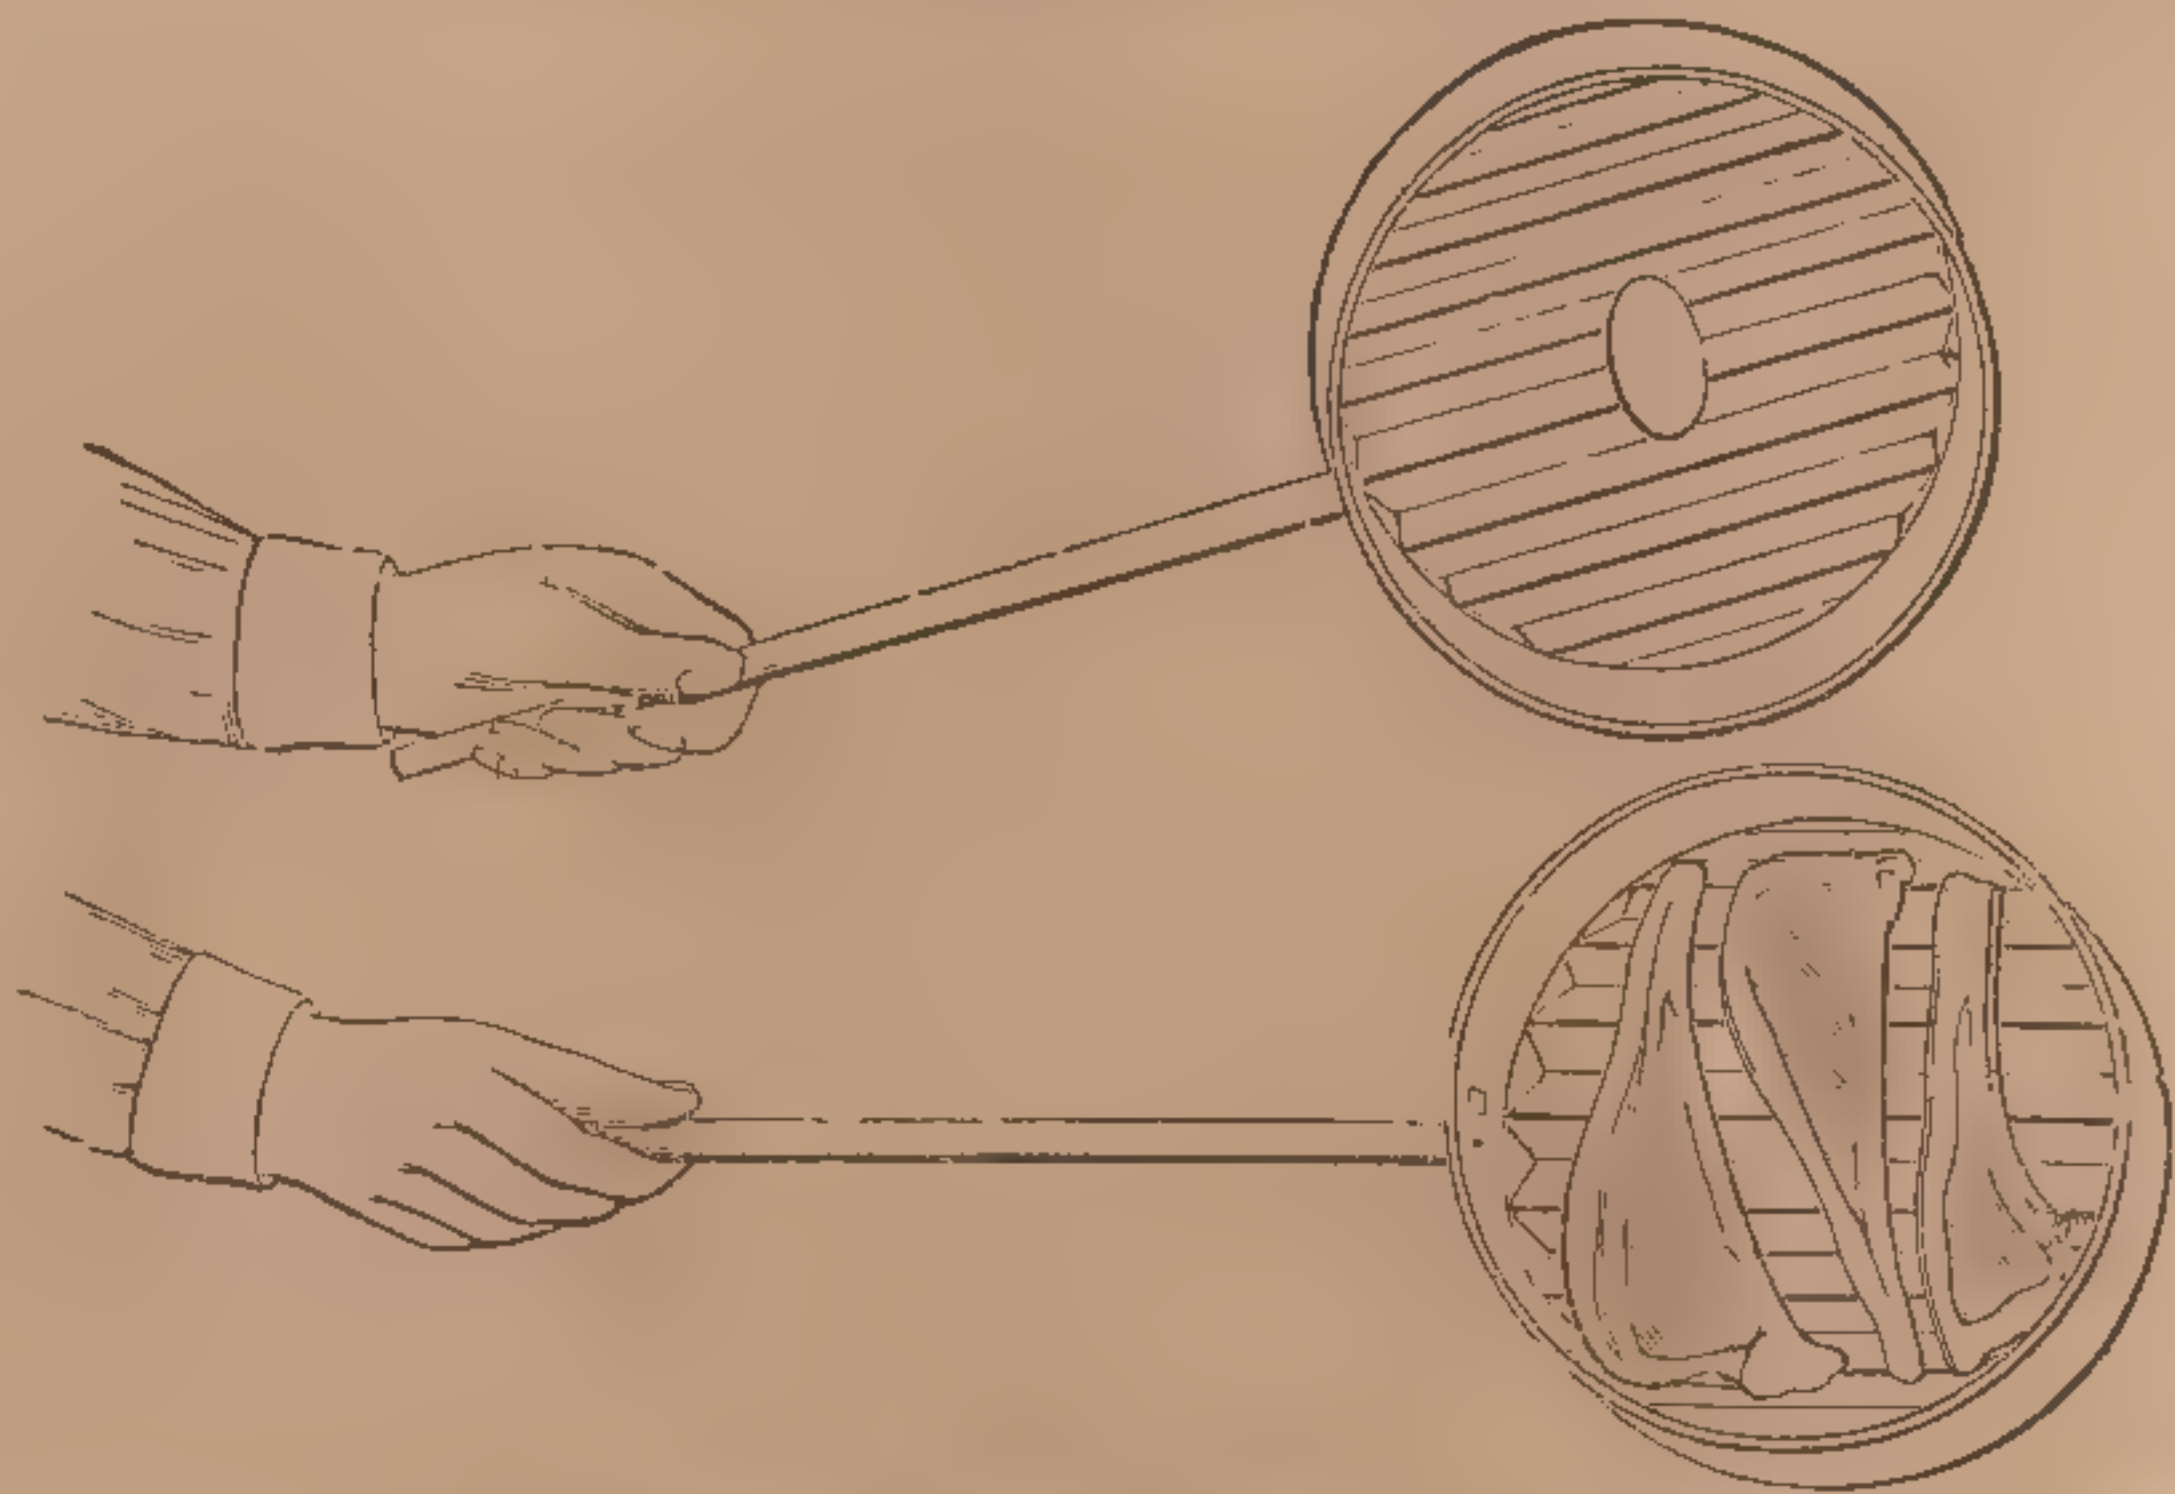

SOUP FOR SIX PERSONS, WITHOUT WATER—EXCELLENT.—Place in Warren's Pot two pounds of lean beef cut in pieces, add six onions, four small turnips, two carrots, one head of celery, spinach (when in season) a handful. Cook for two hours. Strain off and press as much as possible through a sieve, add pepper and salt, two tablespoonfuls of cream may be added.

421 George Street, Sydney.

Memos.

## KITCHEN—Continued.

### CAPTAIN WARREN'S PATENT CORRUGATED BACHELOR'S BROILER.

The superior advantages this broiler possesses over the gridiron and fryingpan are its great despatch and economy in cooking. It consists of two corrugated pans, one inverted, so that its edge fits into the groove of the other, and they are secured together either by a clip or a hinge. The meat to be cooked having been shut up in the broiler, it is only necessary to turn it over occasionally until the cooking is completed; and, as the parts fit perfectly together, it is impossible for the chop, steak, omelette, or fish placed in it to be smoked, burned, or spoiled in any way by any possible accident, while the whole of the gravy is saved.

So thoroughly is the heat economised by the corrugated surfaces that, over a comparatively slow fire, a steak or chop may be well cooked in eight or ten minutes. This broiler is also an excellent chestnut or coffee roaster.

## KITCHEN—Continued.

## CAPTAIN WARREN'S PATENT CURRY PAN.

## TO CURRY RABBIT, CHICKEN, VEAL, KIDNEYS, &amp;c.

Cut in small pieces the quantity required; add a quarter of a pound of onions, sliced very thin, two teaspoonfuls of curry powder, salt to taste, one apple cut very fine, a small vegetable marrow or cucumber cut very small, and put into the larger compartment, shut the ingredients in, and cook for two hours and a half.

N.B.—When vegetable marrow or cucumber cannot be procured, if the meat has been previously cooked, add three tablespoonfuls of milk.

## TO BOIL RICE.

The most inexperienced can boil rice to perfection by the following directions:—

Put the rice in cold water, boil for five minutes, strain off the water; then place it in the small compartment of the curry pot, and cook for one hour without water, stirring once with a fork. The curry and rice to be served in inner pot without removing, with a frill of paper round it.

## SUMMER NECESSARIES.

CHEAVINS FILTER.

SELTZOGENE.

In selecting a FILTER care should be taken to purchase one that combines rapidity of action with the greatest amount of purifying power obtainable. We recommend GEORGE CHEAVINS RAPID WATER FILTERS which has obtained the highest award at all the latest International Exhibitions in the world.

MR. JAMES NORRIE, in his report, considers—“*This Filter as good a one as could be possibly used.*”

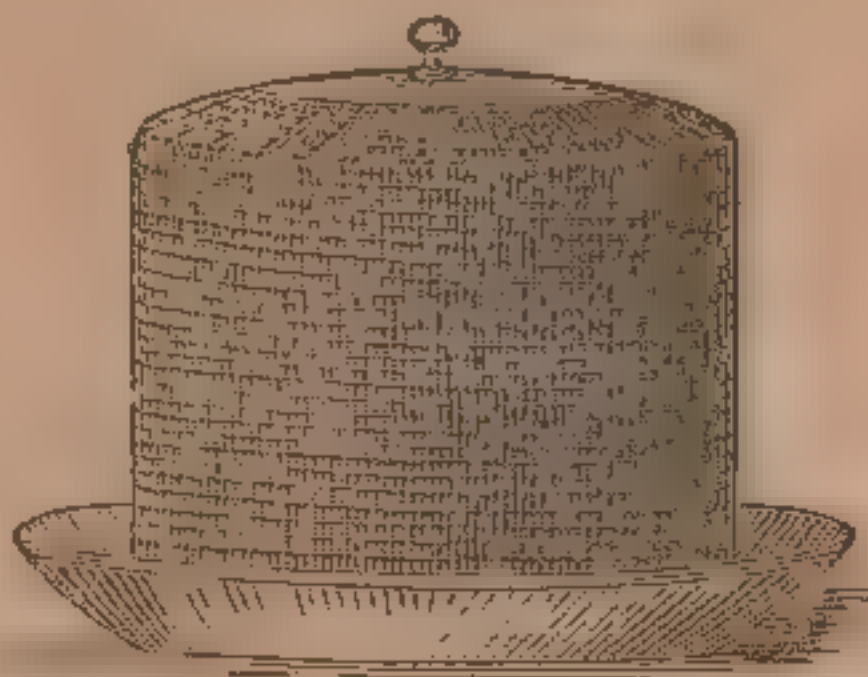

Glass Side Board Filters

Porcelain Side Board Filters

Silicated Carbon Side Board Filters

SELTZOGENS for the manufacture of Soda Water, Lemonade, Seltzer Water, and every other kind of Aerated Drinks will be found economical in use, and a great luxury in hot weather.

Kept in 4 sizes, 2, 3, 5, and 8 pints.

FERGUSON'S CAPILLARY BUTTER COOLER.

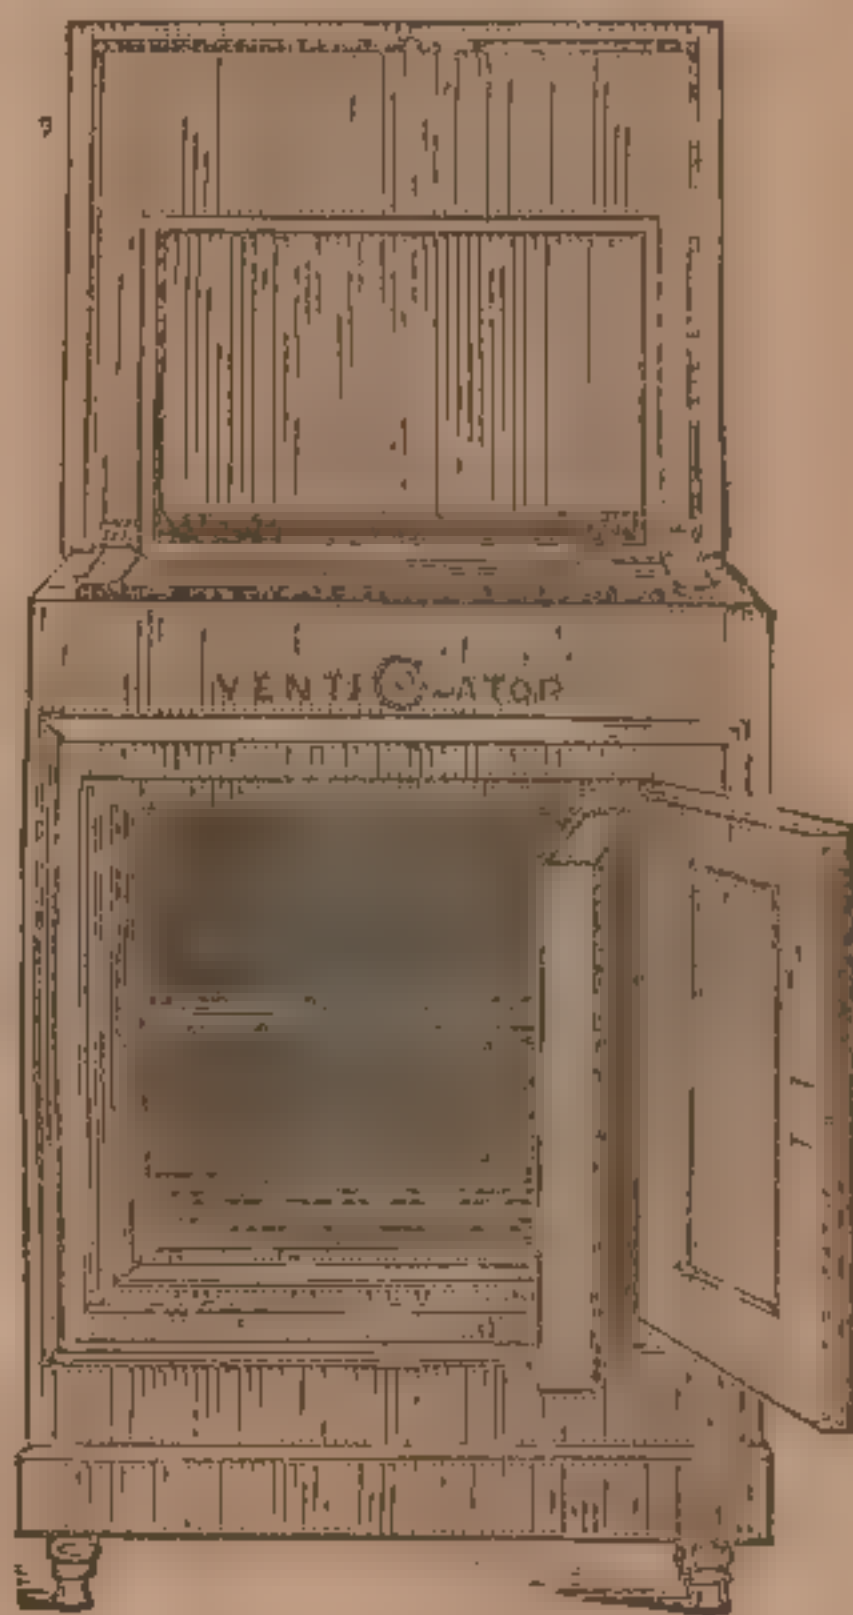

These cheap little Coolers are warranted to give satisfaction. They are invaluable where Ice cannot be obtained and will cool Butter, Jellies, Wines, &c., &c.

421 George Street, Sydney.

Memos.

## Dining and Breakfast Room—Continued.

## REFRIGERATORS.

THESE are made in various sizes, fitted with shelves, and are serviceable in preserving Wines, Fruits, and provisions cool and fresh. They are furnished with two lids—an outer and an inner one. The inner lid, when closed, renders the interior air-tight, and being constructed like the sides and bottom with a substance impervious to caloric, surrounds the ice and all the contents of the Refrigerator with a non-conducting medium, and speedily reduces everything so enclosed to an uniform temperature considerably below the external atmosphere. Both lids should be kept closed, and only opened when necessary to remove anything from the Refrigerator, which should be done as quickly as possible.

A blanket is only necessary in the Box Refrigerators, and should be occasionally washed. In the cupboard shape the ice should simply be placed in the upper compartment without any covering beyond the lids. Care should be taken to see that the syphon at the bottom of the Refrigerator is not stopped up, as an accumulation of water would be liable to contaminate the air.

If at any time any grease, milk, &c., is spilt inside the Refrigerator, it must be cleansed at once, or the contents will be made sour.

*Table of quantity of Ice recommended to be used per week by English Manufacturers.*

No. 1 Refrigerator, Box shape, 40 lbs.	No. 1 Cupboard shape .. 60 lbs.
" 2 " " " 50 "	" 2 " " " 100 "
" 3 " " " " 75 "	" 3 " " " 150 "

We have generally found that a less quantity is sufficient, viz:—

No. 1 Refrigerator, Box shape, 20 lbs.	"No. 1 Cupboard shape .. 30 lbs.
" 2 " " " " 30 "	" 2 " " " 50 "
" 3 " " " " 40 "	" 3 " " " 80 "

## LAUNDRY & WASH-HOUSE.

This Department receives a great deal of our attention, and customers will find in our show-rooms every facility for procuring the *best* as well as the *cheapest* Washing Machine, Mangle, Wringer, Portable Copper, or any other article connected with the Laundry.

We can only illustrate a few of the different Machines kept, but the fullest information, and, if possible, engravings sent on application, should the article required not be enumerated in the Catalogue.

## WASHING MACHINES.

[ANDERSON'S PATENT WASHING MACHINE.]

### DIRECTIONS FOR USE.

The clothes should be soaked over-night in warm suds, and passed through a wringer before being placed in the Washer, care being taken to thoroughly soap any dirty parts. Prepare sufficient supply of good strong hot suds.

#### *To put the clothes in the washer—*

In placing the articles they must not be laid on the bottom and one put on top of the other; but place the first garment in front of the Swing Board on the fluted side against the end of the Washer, the next against that, and so on until the required amount is put in. The Family size should hold five or six shirts, or about three sheets, or equal bulk of any other articles, and two pailsful of the prepared suds. Too little suds will cause the clothes to lay too close to the bottom and make the work heavy for the operator; when this is found to be the case a little more suds should be added. Too much suds will cause the clothes to float too high and carry them over the swing-board.

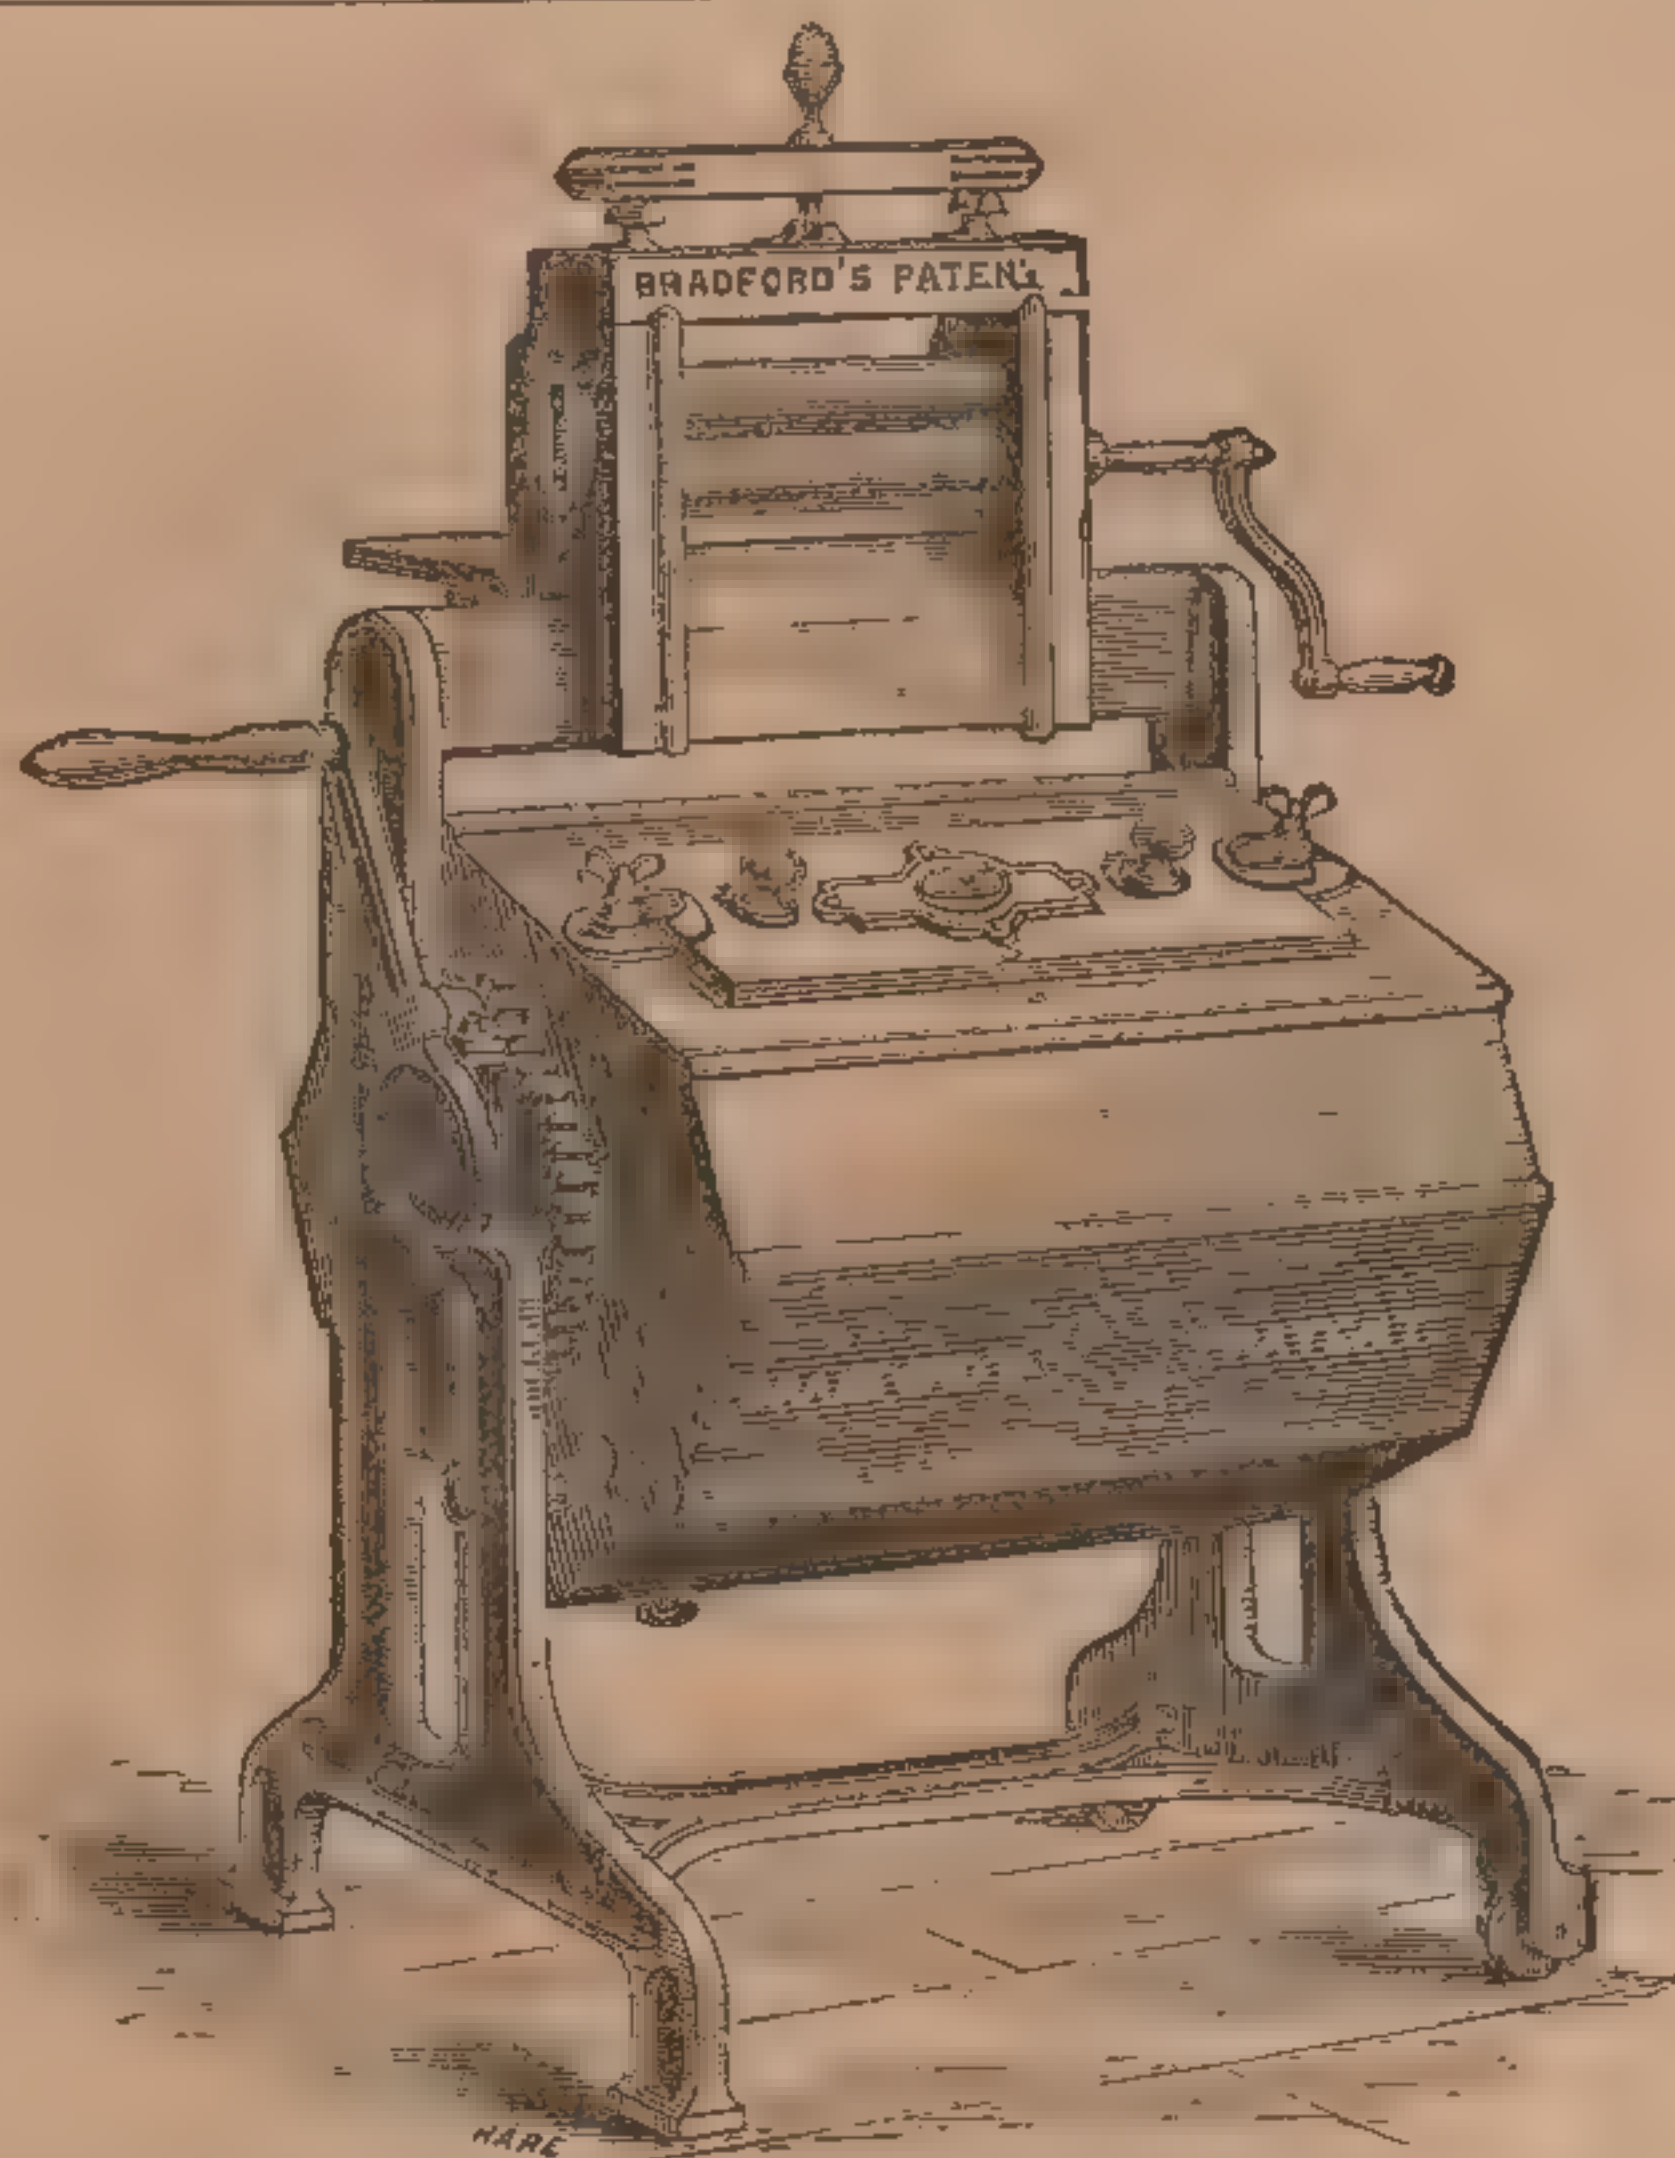

When the Washer is properly filled with clothes and suds, commence operations by rising the lever handle, and bring it down with a moderate pressure at the rate of about sixty strokes to the minute. *Three minutes will be sufficient to cleanse six shirts, or a proportionate quantity of other clothes, unless they are unusually dirty.*

The Champion Washer is used precisely the same, but will hold one-fourth more. The wheel should be turned from fifty to sixty revolutions a minute.

*421 George Street, Sydney.*

Memos.

## BRADFORD'S PATENT VOWEL WASHING MACHINE.

## DIRECTIONS FOR USE.

I. Put into the Machine clothes and water according to the following proportions:—

For Vowel A size, say 10 shirts	or other	and 2	gallons
" " I " " 20 "	articles in	" 5	of
" " Æ " " 12 "	proportion.	" 3	water.

If too much water is used, the cleansing power of the Machine is diminished; if the clothes are not steeped, but put in dry (the best way), the water should not be hotter than the hand can bear.

II. *Important.*—The clothes must be gathered up in the hands and packed side by side from left to right of Machine; the closer they are pressed together, the more they will rub each other, and the quicker will they be washed. If put into the Machine "any way," or one upon the other, they cannot rub each other, in accordance with the constructed principle of the "Vowel" Machine. The little extra time occupied in thus placing the clothes is absolutely necessary to good washing.

III. The soap should be sliced and thoroughly dissolved by absolute boiling, in proportion of 1 lb to the gallon of water, so as to form a jelly when cold. The quantity requisite for each bath will depend upon the articles: if greasy or new, more is required; but with ordinary clothes use as little as possible, just sufficient to make a moderate lather, or ley (say about a tea-cup full.) *A thick, slippery suds "won't wash."*

IV. When commencing, open the ventilator for a few turns, or withdraw the plug for an instant, to allow the escape of air, then close it. The washing compartment should revolve about 20 times per minute, with a slight pause after each turn of the tub, when the lid is uppermost. The handle of Vowel A and Æ turns 3 times for the tub once, and with the larger size 4 or 5 times for the tub once.

V. The time required for washing or "firsting" is, say, 10 to 15 minutes, according to class of article; and for "seconding," say, 5 minutes, in boiling water, and which, for many articles, is equal to a "boiling," the steam being confined. The "seconding" water is available for the next "firsting," by adding soap jelly.

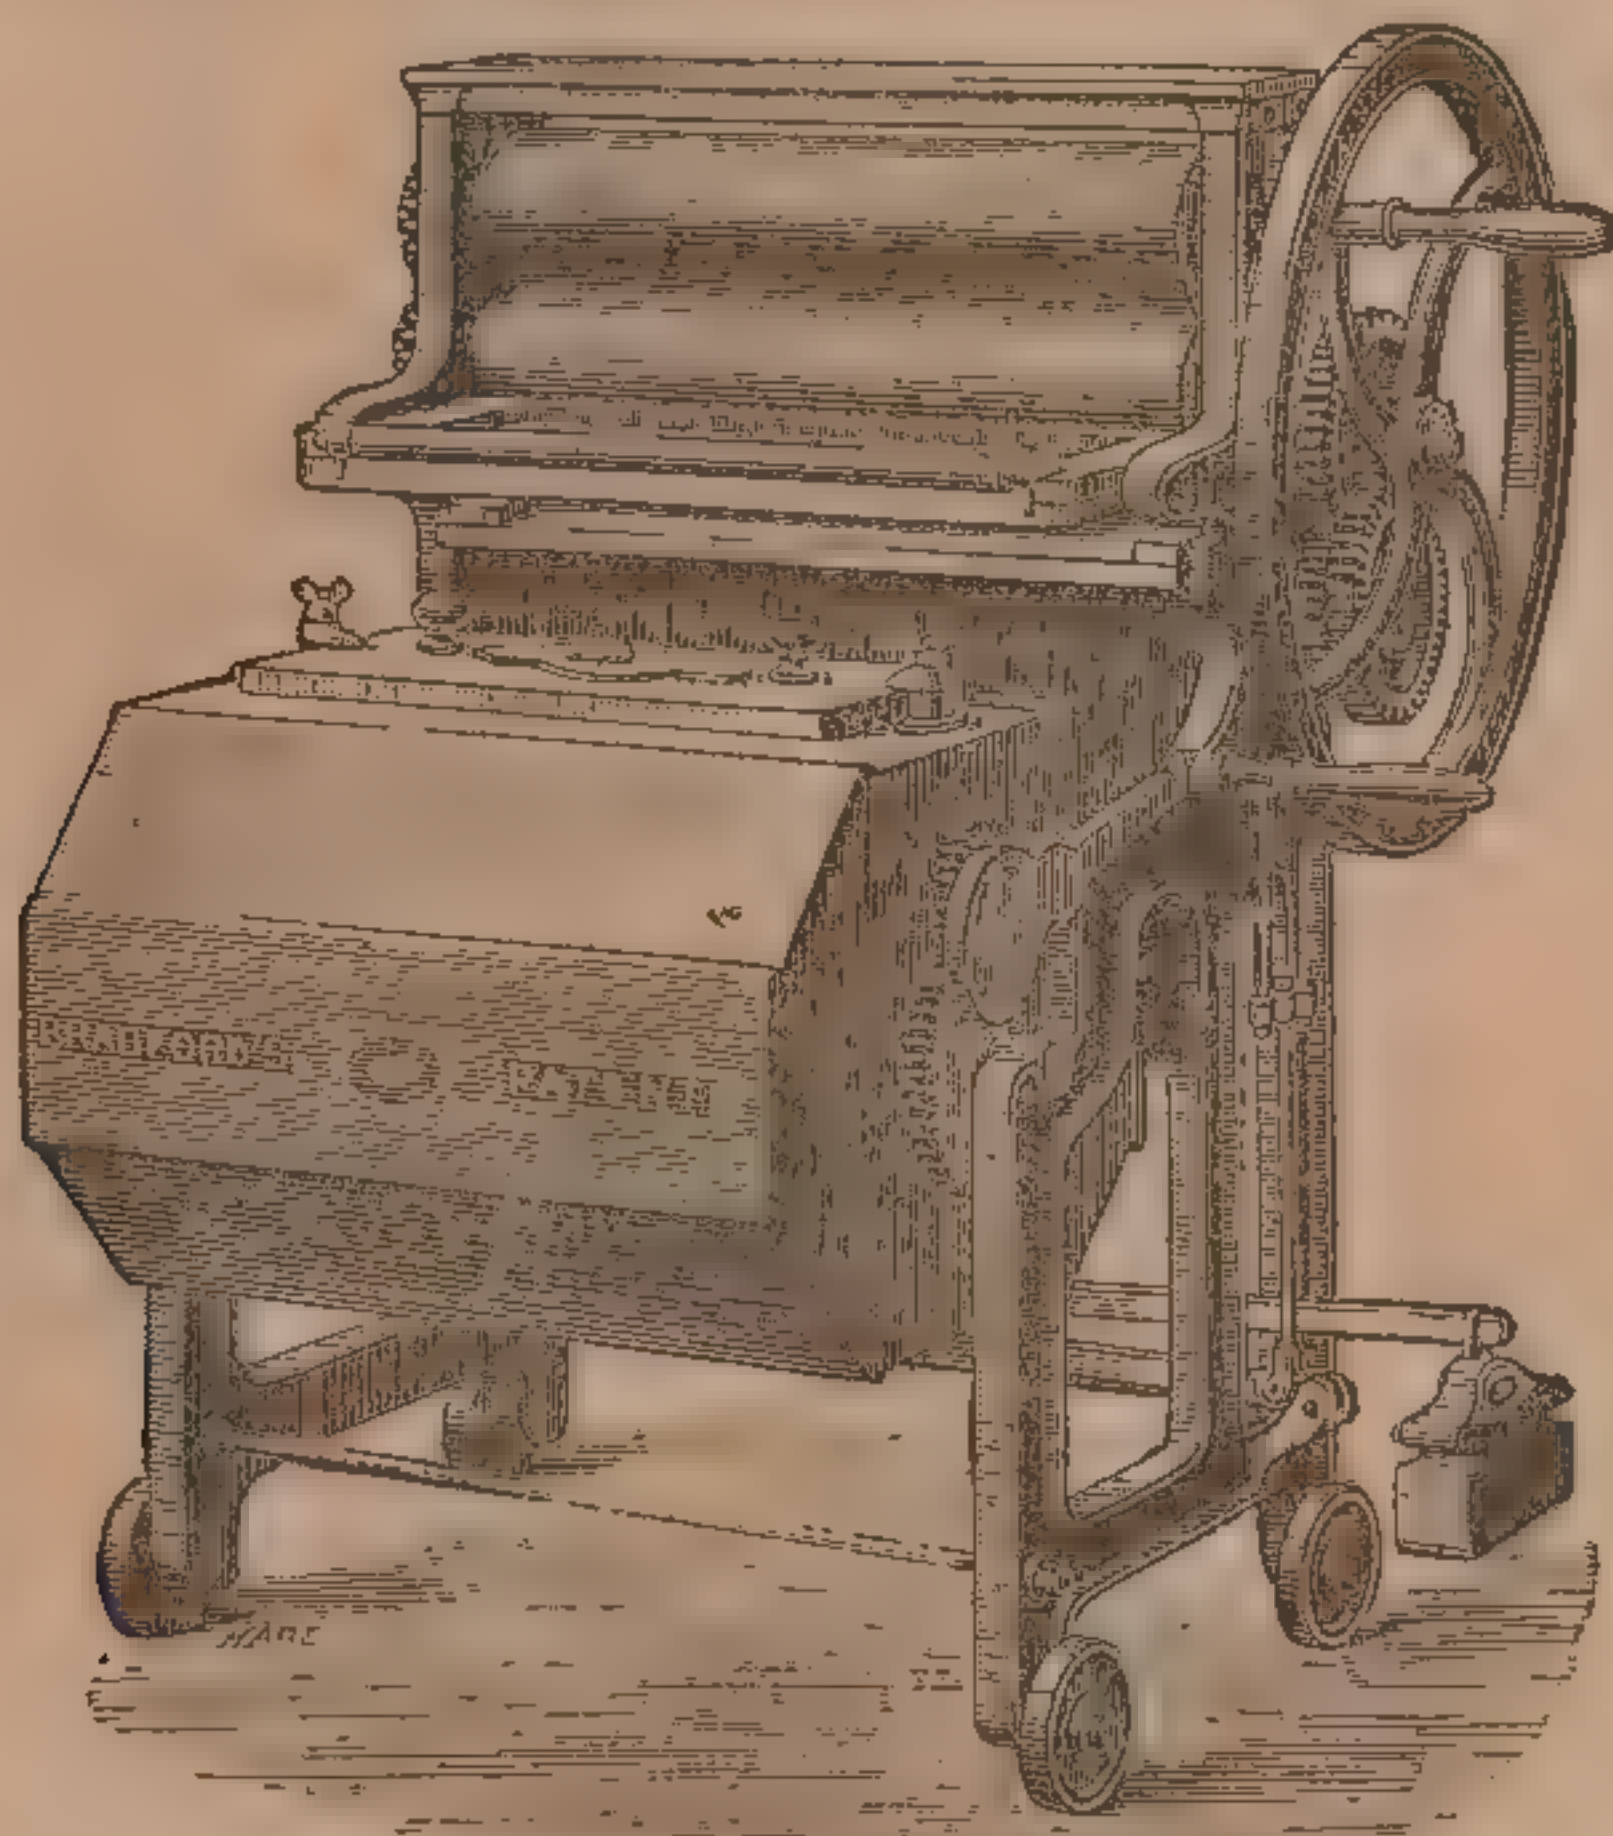

VI. The steeping or preparatory soap rubbing of articles very much soiled, such as wrist-bands, neck-bands, shirts, &c., the practical washerwoman will regulate according to the hardness or softness of the water used; when it is moderately soft, and the directions as to the quantity, both of water and soap, and the proper "placing in" of the clothes are attended to, that is, side by side, as explained above, steeping or preparatory rubbing can be dispensed with, and the clothes put into the machine dry.

*Note.*—Keep all the bearings carefully oiled.

421 George Street, Sydney.

Memos.

**Laundry and Wash-house—Continued.****BRADFORD'S PATENT VOWEL Æ WASHING & MANGLING MACHINE COMBINED.**

This MACHINE will be found very serviceable where space in the Laundry is an object as the combined machine takes up no more room than an ordinary mangle.

The instructions for washing are the same as on preceding page.

**THE HOME COMBINED WASHING & MANGLING MACHINE.**

This MACHINE is manufactured to supply the same want as the Combined Vowel Machine illustrated above, but its action is somewhat different.

**INSTRUCTIONS FOR USING THE HOME WASHER.**

I.—Before using the Washer the first time, scald it out with hot water and soap, to take the stain or colouring out of the wood.

II.—Fill the Washer not less than three-fourths full with soft water, which must be boiling hot.

III.—Dissolve a pound of good soap, and pour it into the Washer.

IV.—Soap the parts of the garments where badly soiled.

V.—Wash the finest articles first to give them the benefit of clean water.

VI.—Do not crowd the Machine with too many articles, or heap them one upon the other, but place them evenly around the central shaft or float, by which means it will work free and easy.

VII.—When washing small articles, the handle may be turned either way; but for blankets, counterpanes, &c., it is better not to reverse the motion.

VIII.—Shake the clothes when lifting them out of the Washer, and always avoid lumps or uneven foldings in putting them through the rollers.

IX.—While working the Washer, stand erect and close up to the Machine, and let one hand rest on the top of it, as the labour is much less than standing off at a distance.

X.—After using the Washer, rinse it out with cold water to clean away any sediment that may be left at the bottom.

NOTE.—Oil the bearings occasionally with Sperm Oil.

THE No. 1 WILL WASH AT ONE OPERATION—60 lace collars, under sleeves, &c., time, 2 minutes; 40 linen collars, handkerchiefs, &c., time, 3 minutes; 12 napkins, towels, &c., time, 3 minutes; 5 shirts, time, 5 minutes; 1 quilt or blanket, time, 5 minutes.

*421 George Street, Sydney.*

# WOLTER & ECHBERG'S NEW FAMILY WASHING MACHINE.

**DIRECTIONS FOR USE.**

Soap the clothes in the usual way, filling the box half-full of clothes, up to the pencil mark ; pour in sufficient warm water to cover the clothes well ; screw the lid down and swing the box up and down for about five minutes. The water may be used a little warmer than for hand washing.

*N.B.—When the machine is not in use, reverse the lid and allow no water to remain in the box.*

## BAKER'S PATENT BOX MANGLE.

This is undoubtedly the best MANGLE manufactured,  
and will be found all that can be desired  
where room is not an object.

### DIRECTIONS FOR USE.

In the first place the Mangle should be filled up either with bricks or stones until the desired weight is obtained. Each Mangle is supplied with three rollers, two of which are intended for constant use. The other may be filled with clothes meanwhile. After taking out the rollers, lay one on the mangling-cloth, and having filled it with clothes, put down one of the iron guides or levers at the end of the Mangle, and turn the handle until the box is forced up on the guide or lever; then insert the filled roller. Prepare the other roller in the same manner and turn down the lever at the other end of the Mangle, and when the box returns insert the second roller. Now turn up both levers out of the way of the box, and continue turning the handle until the clothes are finished.

To take out the rollers the levers must be again turned down, the box forced on to them, and the rollers are then free, and the fresh roller can be inserted.

In *BAKER'S PATENT MANGLE* the action is automatic, and the handle must be turned only one way.

NOTE.—Keep the bearings well oiled.

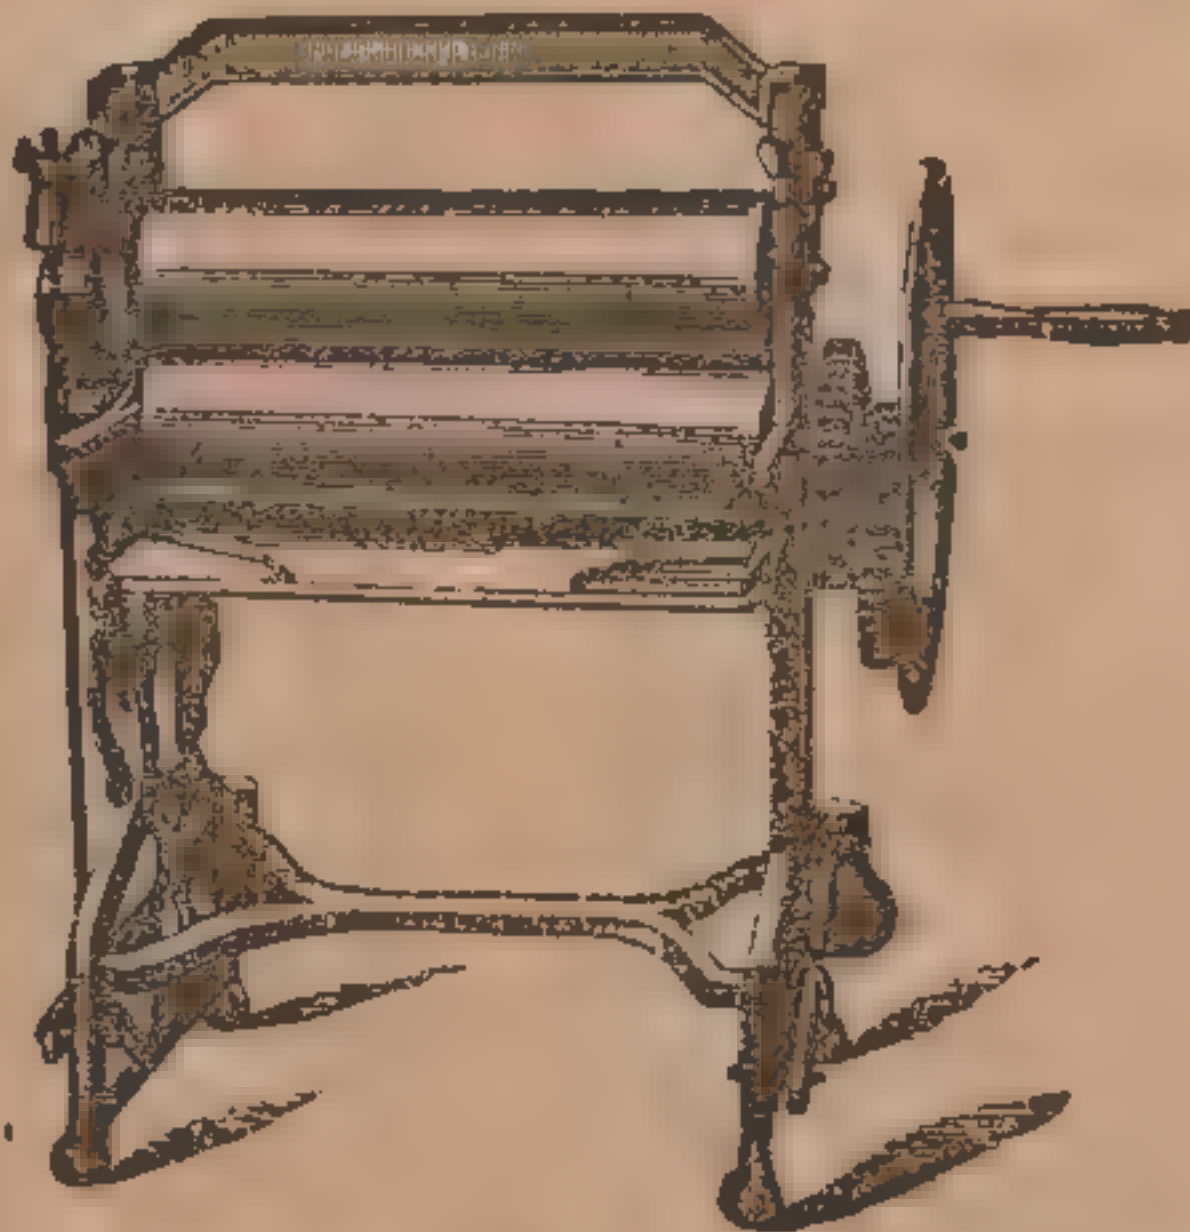

## BOX MANGLES, WITH ROPES.

These Mangles are also kept in stock, and although they are cheaper, cannot be recommended so well as Baker's Patent.

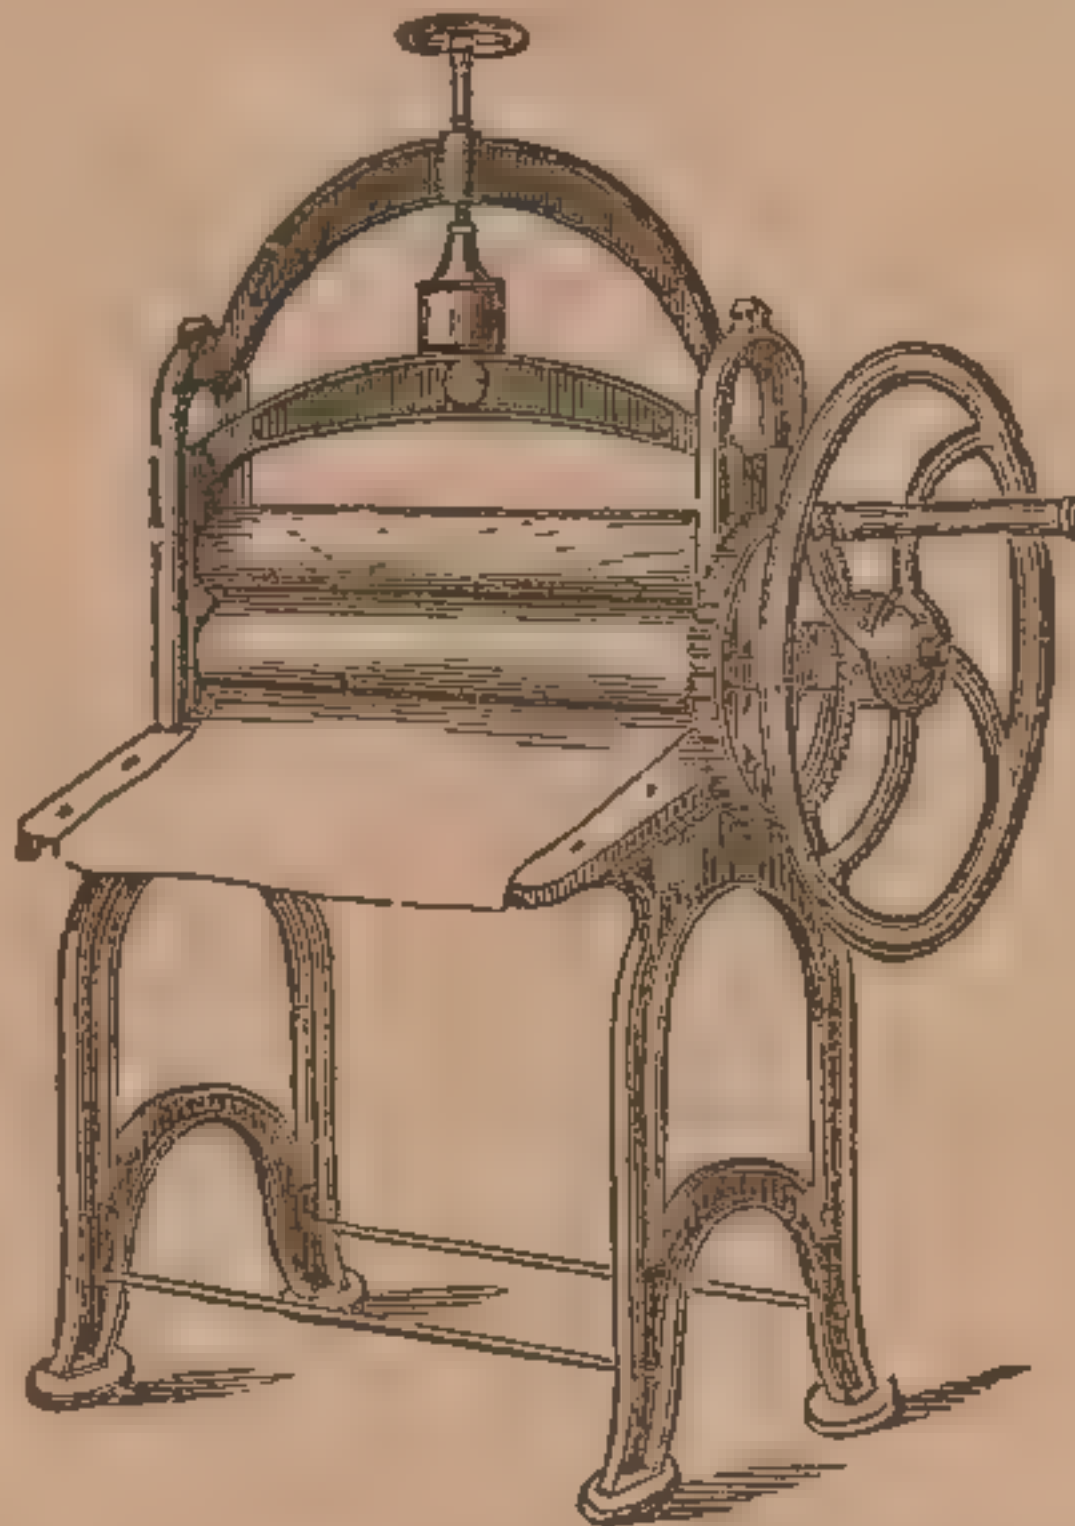

*421 George Street, Sydney.*

Memos.

**Laundry and Wash-house—Continued.****Bradford's Patent 2 and 3-Roller Mangle.****No. 0, with 24 inch Rollers.****No. 1, " 27 " " " with strong brass caps.****No. 2, " 30 " " " " " " "**

These machines are constructed upon the most correct lever and weight principle, and are recommended as the most simple and efficient Mangling Machines yet introduced.

**Low & Duff's Patent 2 and 3-Roller Mangle****Two Roller, 20 inch**

"	"	24	"
"	"	26	"

**Two Roller, 30 inch**

<b>Three</b>	"	24	"
"	"	30	"

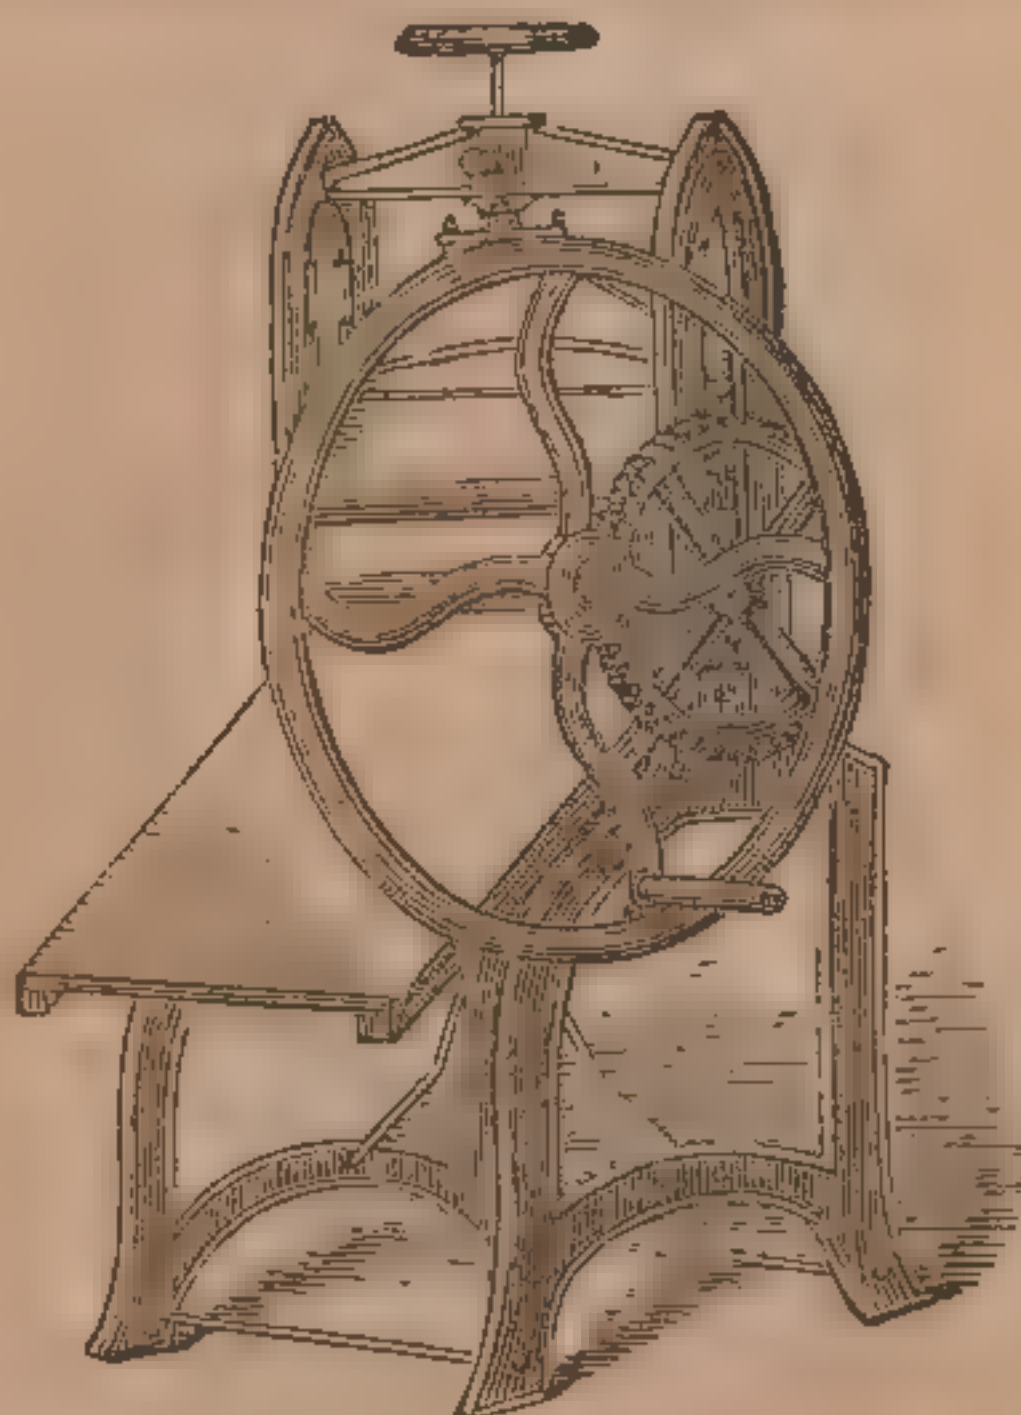

In these Mangles the pressure is given by forcing a screw down upon a solid vulcanized india-rubber collar or boss, which, being perfectly elastic, adapts itself readily to the texture of the clothes to be mangled.

It is cheap and strong, and can be recommended for family use.

421 George Street, Sydney.

Memos.

**Laundry and Wash-house—Continued.****NICHOLL'S PATENT 2 & 3 ROLLER MANGLES**

<b>Two Roller</b>	-	-	-	-	<b>24 inch.</b>
" "	-	-	-	-	<b>30 inch.</b>
<b>Three Roller</b>	-	-	-	-	<b>30 inch.</b>
" "	-	-	-	-	<b>36 inch.</b>

THIS Mangle may be recommended as being the best Mangle that can be used for private families. The pressure is very well arranged in connection with best steel springs, which are adjusted by a screw at the top. The wood used in the rollers is of best selected timber, and not liable to split.

**TWO-ROLLER TABLE MANGLES.**

These useful little Mangles are kept in one size only—24 inch—and are so arranged that they can be fixed on a table or sideboard in a very short time.

*Directions for using 2-Roller Mangles.*

The clothes should be folded ready for the Machine, and the different thicknesses properly sorted out, so that when the springs are adjusted for one class of clothes, it will not be necessary to alter the pressure until they are all mangled.

Pass the clothes through the rollers from front to back two or three times, and do not wrap them round the roller.

*Directions for using 3-Roller Mangles.*

First unroll the cloth from the middle roller, then lay the cloth to be mangled on it, care being taken to place articles of the same thickness side by side; then turn the handle and observe that the cloth winds fairly on the roller; continue the turning a few minutes, when the article will be found to be sufficiently mangled. Reverse the turning of the handle to unroll the cloth.

If the texture is thick release the pressure by turning the handle at top, and screw it up if thinner articles are next mangled. A few trials will prove the best guide for this.

**NOTE.**—Keep all the bearings well oiled.

421 George Street, Sydney.

Laundry and Wash-house—Continued.

## WRINGING MACHINES.

### BRADFORD'S PATENT WRINGING MACHINE.

WRINGING MACHINES will be found very useful for lessening the labour attending wringing by hand, and also preventing the tearing of delicate fabrics. The rollers being made of India-rubber are very pliable, and allow both the finest fabric as well as the largest blanket to pass between the rollers without the slightest injury; they are easily fixed on to the Washing Machine or Tub.

BRADFORD'S ACORN A MACHINE for general purposes.

" " C " a larger size, and suitable for all purposes.

AMERICAN "CROWN" WRINGERS, made of galvanized iron, very strong

AMERICAN EUREKA WRINGERS, made of galvanized iron, very strong

AMERICAN NOVELTY WRINGERS, made of wood with galvanized iron working parts, will be found strong and serviceable for general family use.

### PORTABLE WASHING COPPERS

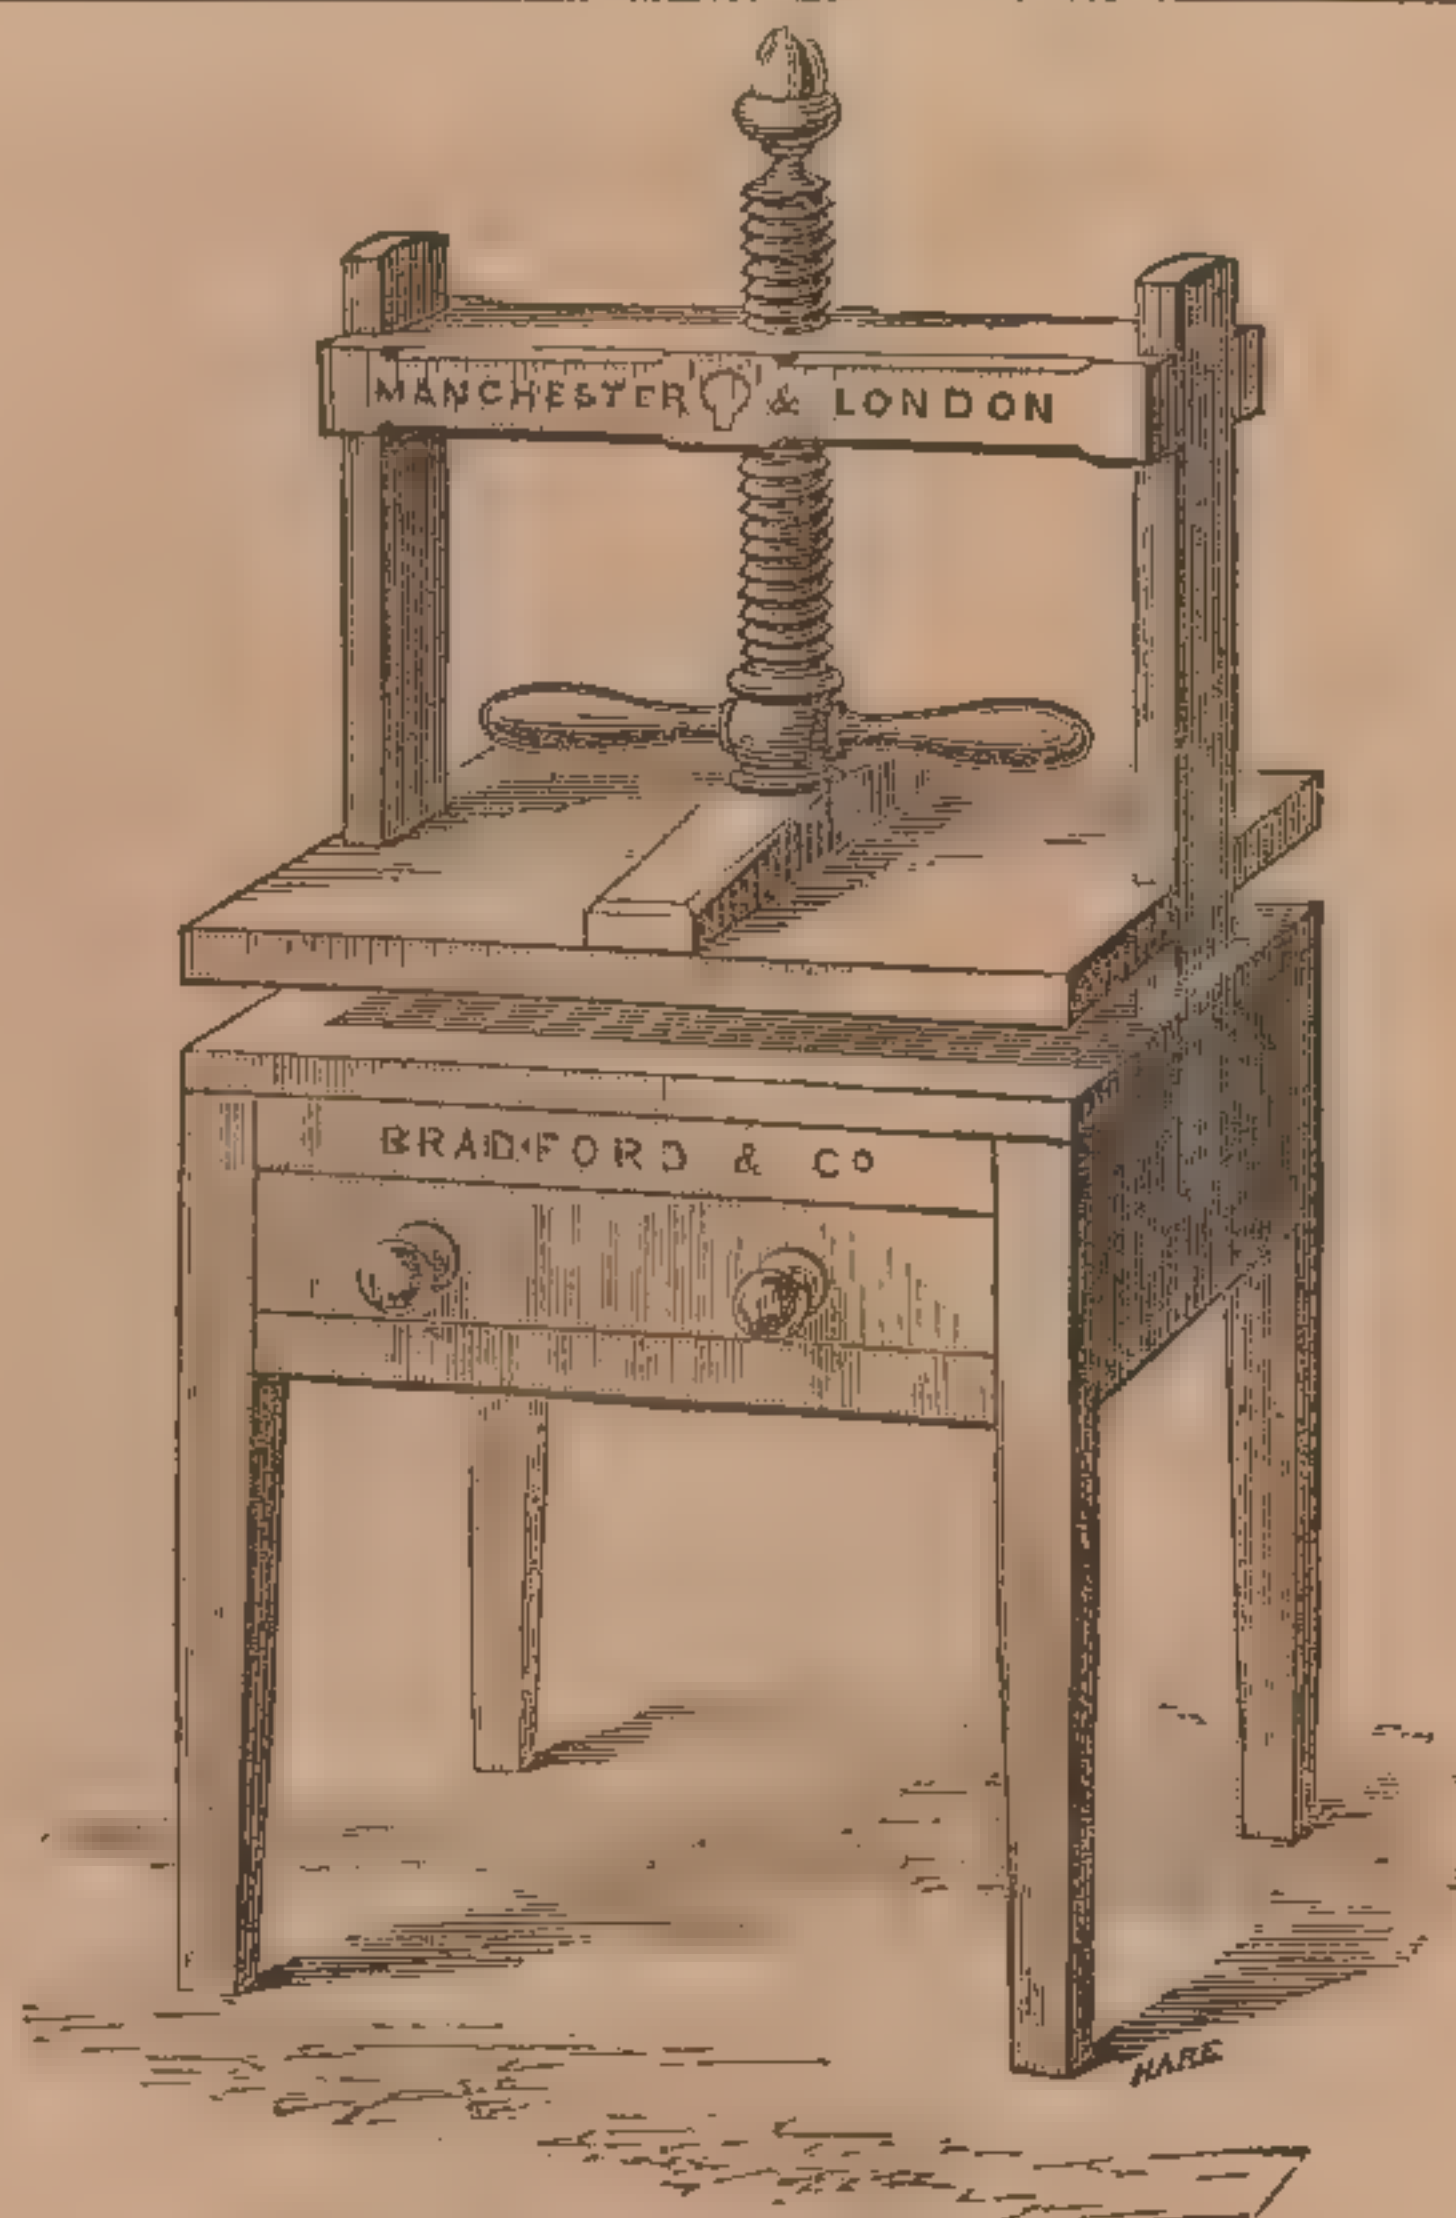

For use where the Wash-house is not provided with a fixed Washing Copper; can be used in the open air, and are furnished with the necessary piping complete.

## LAMPWARE.

## THE BRIGHTON LAMP.

This lamp is simple in its construction, economical in burning, and of great illuminating power, the rays of light being equally distributed over the room by means of a disc in the centre of the flame, which is thus spread to the size of a crown-piece, whereas the wick is not larger than a shilling. A non-conductor is inserted in the lower part of the burner, so arranged as to prevent the heat passing from the lamp to the oil, which is thus kept cool, and all danger of explosion prevented.

Plain Font, with Brass or Bronzed Pedestal

CUT STAR     „                 „                 „

RICHLY CUT FONT, with Brass or Bronzed Pedestal

HANDSOME CRYSTAL PEDESTAL LAMP, with Plain, Cut Star, or richly cut Fonts and Electroplated burner and fittings.

## THE ANUCAPNIC LAMP.

The advantage claimed for this lamp is a full supply of oil to the flame, so that the burner will carry a full flame till all the oil is consumed. This result is obtained by using *two wicks* in the wick tube instead of one wick. The two wicks are so closely pressed together that the two wind up and down as accurately as if they are one wick. The parts of the wick below the burner, however, remain separate, and thus there are *four surfaces of wick* exposed to saturation by the oil instead of two, as in the old system. The flow of oil is thus continuous, and if the reservoir contains only a small quantity, the light obtained is as good as if the reservoir were full. One important advantage which this lamp has is that no chimnies are used, the combustion being perfect with the use of the globe only.

BOHEMIAN GLASS VASE LAMPS, for dining-room

421 George Street, Sydney.

Memos.

**Lampware—Continued.****THE "SILBER" LAMP.**

The light produced by this burner is intensified to 22 candle-light more than is produced by other lamps using the same size wick, while the consumption of oil is considerably diminished. The method of trimming is perfectly simple, new wicks being put in at the top (instead of at the bottom), with the greatest facility, and without removing the burner from the lamp. The mechanism of the burner has been perfected, so that, although a flat wick is used, it is brought to the top of the burner ready for lighting in a circular form.

**THE "SILBER" PUNKAH LAMP.**

The burner of this lamp is similar to the one described above, but the globe is of peculiar construction, and permits the lamp to be used in a draught or beneath a punkah. It will be found particularly desirable during hot weather.

**THE DUPLEX LAMP.**

This lamp differs from the others in being fitted with two wicks, each giving a separate flame. They are, however, brought together, and only one chimney is used. The light is very powerful, and burns with a steady flame. The burner is so arranged that the supply of air to the flame is such as to cause complete combustion of the gases, and consequently there is no smell from the flame.

**THE ANUACAPNIC DUPLEX LAMP.**

Is a new lamp, made on a similar principle to the above, but does not require any chimney, the combustion being perfect with the globe only.
